need to add .old, .backup,. ~.

To access backup files

Basically saying that when both of the fields username and password are submitted then both of them are stored in two variables and if both are same it print a statement and in else condition hter is an if both of their shalhash is same then it will print flag

So there are no strings for that we have to use something else

We will make the variables array by adding [] which will provide the variables empty arrays and their hash is null so null=null

Then we will get the flag
